*Page (2), bottom left column, lines 15 to 20*

In the rinsing process, the rotation drum (6) is rotated with wind being sent thereto by the fan (15) and water being fed thereto from the water feed pipe (27). Here, water, which is sprayed in a mist state, is turned into mist more efficiently and sprayed further strongly by virtue of the wind, and thus the water is diffused to be directly sprayed onto all the articles of clothing and permeates them more efficiently.
